

**In the Abstract:**

Please amend the abstract as follows:

A communications apparatus, ~~such as a portable radiotelephone, comprises~~ includes a housing (40) containing a printed circuit board (PCB) (12) having a ground plane (16) and electronic components in rf shields (18) thereon. A planar antenna (10), ~~for example a planar inverted L antenna (PILA),~~ is mounted spaced from the ground plane and a dielectric (14), ~~for example, air,~~ is present in a space between the PCB and the planar antenna. A feed (36) couples the planar antenna (10) to the rf components. ~~The feed comprises parallel L-C resonator circuit components (42), a transmission line, or any other predominantly reactive network for reactively tuning the antenna. In the case of a dual band antenna the components are selected so that a lower frequency is tuned inductively and a higher frequency is tuned capacitively. The components, which may be discrete or distributed, are mounted on the PCB or a part of the planar antenna structure which is not subject to detuning by the user in normal operation of the apparatus.~~
